

2022 APS Available Seed List

P. lactiflora Seed (10-50 seeds/packet; \$2.00/packet)

Paeonia lactiflora cultivars are the most common group of herbaceous peonies and are best known their fragrance, cut flower properties and ease of growth. Seeds generally take 4 to 7 years to become flowering size. For more information on this group and other peonies visit the APS website's many resources. For reference, the [Peony Registry](#), found on the APS website, has many images of cultivar flowers occurring in the list below.

Herbaceous Hybrid Seed (5-25 seeds/packet; \$2.00/packet)

Herbaceous Hybrid peonies are those arising from hybridization of various species or from crosses of existing hybrids. Flower form, flower size, plant habits and bloom times are highly variable from cultivar to cultivar. Most bloom before P. lactiflora cultivars. Unique coloration and other attributes are often seen in this group. Seeds generally take 4 to 7 years to become flowering size. For more information on this group and other peonies visit the APS website's many resources. For reference, the Peony Registry, found on the APS website, has many images of cultivar flowers occurring in the list below.

Species and Species Cross Seeds (5-15 seeds/packet; \$2.50/packet)

Peony species' origins are in nature (wild peonies). They are rare plants in nature and in American gardens. Most are small in stature and make excellent rock garden candidates. They all require sharply drained soils with good air circulation, but are among the most interesting and sought after plants in the world. A number of seeds listed this year are seldom available and are in short supply.

Woody Peonies (Tree Peony) Seed - Suffruticosa Group & Suffruticosa Group with *P. rockii* influence- (5-15 seeds/packet; \$2.50/packet)

Woody peonies, often referred to as "Tree peonies" are plants with persistent woody stems. They produce large other worldly flowers and bloom before most herbaceous peonies. Culture is similar to other peonies and are not difficult to grow in USDA Hardiness Zones 4 to 8. *P. suffruticosa* is a hybrid swarm developed over the millenia in China and furthered in Japan, Europe and the United States. Seeds on this list are mostly from highly sought after Japanese Suffruticosa Group cultivars. Most are historic cultivars and predate peony registration procedures, but a number can be found in the Peony Registry.
